

What is Python & Getting Started

Lesson Notes

Python is a popular programming language created in 1991 by Guido van Rossum. It is designed to be easy to read and write and can be used for games, websites, robots, and many other applications.

Why Python is special

- It's easy to read and write because the code looks a lot like English.
- It's versatile and can be used for games, websites, robots, and more.
- It is used by professional programmers at places such as NASA, Google, and YouTube.

Your First Python Command

The `print()` command displays a message on the screen.

```
print("Hello, PythonKid!")
```

The parentheses contain what we want to print, and quotation marks indicate text, called a string.

Try More Print Commands

```
print("Welcome to Python!")  
print("Python is awesome!")  
print("Let's start coding!")
```

Common Mistakes to Avoid

Forgetting quotation marks or parentheses can cause an error. Use `print("Hello, PythonKid!")` with both correctly.

Mini Project

Create a welcome script that introduces yourself and shares a fun fact.
